## C7 CARBONATE TAXANE COMPOSITIONS

## REFERENCE TO RELATED APPLICATION

This application is a continuation based on Serial No. 09/776,137 filed February 2, 2001 which claims priority from U.S. provisional application Serial No. 5 60/179,671, filed on February 2, 2000.

## BACKGROUND OF THE INVENTION

The present invention is directed to novel taxanes which have exceptional utility as antitumor agents.

The taxane family of terpenes, of which baccatin III and taxol are members, has been the subject of considerable interest in both the biological and chemical arts. Taxol itself is employed as a cancer chemotherapeutic agent and possesses a broad range of tumor-inhibiting activity. Taxol has a 2'R, 3'S configuration and the following structural formula:

15 wherein Ac is acetyl.

Colin et al. reported in U.S. Patent 4,814,470 that certain taxol analogs have an activity significantly greater than that of taxol. One of these analogs, commonly referred to as docetaxel, has the following structural formula:

Although taxol and docetaxel are useful chemotherapeutic agents, there are limitations on their effectiveness, including limited efficacy against certain types of cancers and toxicity to subjects when administered at various doses. Accordingly, a need remains for additional chemotherapeutic agents with 5 improved efficacy and less toxicity.

SUMMARY OF THE INVENTION

Among the objects of the present invention, therefore, is the provision of taxanes which compare favorably to taxol and docetaxel with respect to efficacy as anti-tumor agents and with respect to toxicity. In general, these taxanes 10 possess a carbonate substituent at C-7, a hydroxy substituent at C-10, and a range of C(2), C(9), C(14), and C(13) side chain substituents.

Briefly, therefore, the present invention is directed to the taxane composition, per se, to pharmaceutical compositions comprising the taxane and a pharmaceutically acceptable carrier, and to methods of administration.

15 Other objects and features of this invention will be in part apparent and in part pointed out hereinafter.

10 Taxanes having the general formula 1 may be obtained by treatment of a  
 $\beta$ -lactam with an alkoxide having the taxane tetracyclic nucleus and a C-13  
metallic oxide substituent to form compounds having a  $\beta$ -amido ester substituent  
at C-13 (as described more fully in Holton U.S. Patent 5,466,834), followed by  
removal of the hydroxy protecting groups. The  $\beta$ -lactam has the following  
15 structural formula (3):

(3)

wherein  $P_2$  is a hydroxy protecting group and  $X_3$  and  $X_5$  are as previously defined  
and the alkoxide has the structural formula (4):

(4)

20

wherein M is a metal or ammonium,  $P_{10}$  is a hydroxy protecting group and  $R_2$ ,  $R_9$ ,  
 $R_7$  and  $R_{14}$  are as previously defined.

Alkoxide 4 may be prepared from 10-deacetylbaaccatin III (or a derivative thereof) by selective protection of the C-10 hydroxyl group and then acylation of the C-7 hydroxyl group followed by treatment with a metallic amide. In one embodiment of the present invention, the C(10) hydroxyl group of 10-

- 5 deacetylbaaccatin III is selectively protected with a silyl group using, for example, a silylamide or bis(silyl)amide as a silylating agent. Preferred silylating agents include tri(hydrocarbyl)silyl-trifluoromethylacetamides and bis(tri(hydrocarbyl)-silyl)trifluoromethylacetamides (with the hydrocarbyl moiety being substituted or unsubstituted alkyl or aryl) such as N,O-bis(trimethylsilyl) trifluoroacetamide,
- 10 N,O-bis-(triethylsilyl)trifluoroacetamide, N-methyl-N-triethylsilyltrifluoroacetamide, and N,O-bis(t-butyldimethylsilyl)trifluoroacetamide. The silylating agents may be used either alone or in combination with a catalytic amount of a base such as an alkali metal base. Alkali metal amides, such as lithium amide catalysts, in general, and lithium hexamethyldisilazide, in particular, are preferred. The
- 15 solvent for the selective silylation reaction is preferably an ethereal solvent such as tetrahydrofuran. Alternatively, however, other solvents such as ether or dimethoxyethane may be used. The temperature at which the C(10) selective silylation is carried out is not narrowly critical. In general, however, it is carried out at 0 °C or greater.

- 20 Selective acylation of the C(7) hydroxyl group of a C(10) protected taxane to form a C(7) carbonate can be achieved using any of a variety of common acylating agents such as a haloformates. In general, acylation of the C(7) hydroxyl group of a C(10) protected taxane are more efficient and more selective than are C(7) acylations of a 7,10-dihydroxy taxane such as 10-DAB; stated
- 25 another way, once the C(10) hydroxyl group has been protected, there is a significant difference in the reactivity of the remaining C(7), C(13), and C(1) hydroxyl groups. These acylation reactions may optionally be carried out in the presence or absence of an amine base.

- Derivatives of 10-deacetylbaaccatin III having alternative substituents at
- 30 C(2), C(9) and C(14) and processes for their preparation are known in the art. Taxane derivatives having acyloxy substituents other than benzyloxy at C(2) may be prepared, for example, as described in Holton et al., U.S. Patent No. 5,728,725 or Kingston et al., U.S. Patent No. 6,002,023. Taxanes having acyloxy or hydroxy substituents at C(9) in place of keto may be prepared, for example as
- 35 described in Holton et al., U.S. Patent No. 6,011,056 or Gunawardana et al., U.S.

Patent No. 5,352,806. Taxanes having a beta hydroxy substituent at C(14) may be prepared from naturally occurring 14-hydroxy-10-deacetylbaaccatin III.

Processes for the preparation and resolution of the  $\beta$ -lactam starting material are generally well known. For example, the  $\beta$ -lactam may be prepared 5 as described in Holton, U.S. Patent No. 5,430,160 and the resulting enantiomeric mixtures of  $\beta$ -lactams may be resolved by a stereoselective hydrolysis using a lipase or enzyme as described, for example, in Patel, U.S. Patent No. 5,879,929 Patel U.S. Patent No. 5,567,614 or a liver homogenate as described, for example, in PCT Patent Application No. 00/41204. In a preferred embodiment in which the 10  $\beta$ -lactam is furyl substituted at the C(4) position, the  $\beta$ -lactam can be prepared as illustrated in the following reaction scheme:

wherein Ac is acetyl, NEt<sub>3</sub> is triethylamine, CAN is ceric ammonium nitrate, and p-TsOH is p-toluenesulfonic acid. The beef liver resolution may be carried out, for example, by combining the enantiomeric  $\beta$ -lactam mixture with a beef liver

suspension (prepared, for example, by adding 20 g of frozen beef liver to a blender and then adding a pH 8 buffer to make a total volume of 1 L).

Compounds of formula 1 of the instant invention are useful for inhibiting tumor growth in mammals including humans and are preferably administered in 5 the form of a pharmaceutical composition comprising an effective antitumor amount of a compound of the instant invention in combination with at least one pharmaceutically or pharmacologically acceptable carrier. The carrier, also known in the art as an excipient, vehicle, auxiliary, adjuvant, or diluent, is any substance which is pharmaceutically inert, confers a suitable consistency or form 10 to the composition, and does not diminish the therapeutic efficacy of the antitumor compounds. The carrier is "pharmaceutically or pharmacologically acceptable" if it does not produce an adverse, allergic or other untoward reaction when administered to a mammal or human, as appropriate.

The pharmaceutical compositions containing the antitumor compounds of 15 the present invention may be formulated in any conventional manner. Proper formulation is dependent upon the route of administration chosen. The compositions of the invention can be formulated for any route of administration so long as the target tissue is available via that route. Suitable routes of administration include, but are not limited to, oral, parenteral (e.g., intravenous, 20 intraarterial, subcutaneous, rectal, subcutaneous, intramuscular, intraorbital, intracapsular, intraspinal, intraperitoneal, or intrasternal), topical (nasal, transdermal, intraocular), intravesical, intrathecal, enteral, pulmonary, intralymphatic, intracavital, vaginal, transurethral, intradermal, aural, intramammary, buccal, orthotopic, intratracheal, intralesional, percutaneous, 25 endoscopical, transmucosal, sublingual and intestinal administration.

Suitable carriers are readily determined by one of ordinary skill in the art (see, for example, J. G. Nairn, in: Remington's Pharmaceutical Science (A. Gennaro, ed.), Mack Publishing Co., Easton, Pa., (1985), pp. 1492-1517, the contents of which are incorporated herein 35 by reference).

Ethanol is a preferred solvent for use in dissolving the antitumor compound to form solutions, emulsions, and the like.

Additional minor components can be included in the compositions of the invention for a variety of purposes well known in the pharmaceutical industry. These components will for the most part impart properties which enhance retention of the antitumor compound at the site of administration, protect the stability of the composition, control the pH, facilitate processing of the antitumor compound into pharmaceutical formulations, and the like. Preferably, each of these components is individually present in less than about 15 weight % of the total composition, more preferably less than about 5 weight %, and most preferably less than about 0.5 weight % of the total composition. Some components, such as fillers or diluents, can constitute up to 90 wt.% of the total composition, as is well known in the formulation art. Such additives include cryoprotective agents for preventing reprecipitation of the taxane, surface active, wetting or emulsifying agents (e.g., lecithin, polysorbate-80, Tween® 80, pluronic 60, polyoxyethylene stearate ), preservatives (e.g., ethyl-p-hydroxybenzoate), microbial preservatives (e.g., benzyl alcohol, phenol, m-cresol, chlorobutanol, sorbic acid, thimerosal and paraben), agents for adjusting pH or buffering agents

While not being bound to a particular theory, it

25 is believed that the ethanol solubility of the antitumor compound may be directly related to its efficacy. The antitumor compound can also be capable of being crystallized from a solution. In other words, a crystalline antitumor compound, such as compound 1393, can be dissolved in a solvent to form a solution and then recrystallized upon evaporation of the solvent without the formation of any

It is also preferred that the antitumor compound have an ID<sub>50</sub> value (i.e, the drug concentration producing 50% inhibition of colony formation) of at least 4, 5, 6, 7, 8, 9, or 10 times less than that of paclitaxel when measured according to the protocol set forth in the working examples.

35 Dosage form administration by these routes may be continuous or intermittent, depending, for example, upon the patient's physiological condition,

whether the purpose of the administration is therapeutic or prophylactic, and other factors known to and assessable by a skilled practitioner.

Dosage and regimens for the administration of the pharmaceutical compositions of the invention can be readily determined by those with ordinary skill in treating cancer. It is understood that the dosage of the antitumor compounds will be dependent upon the age, sex, health, and weight of the recipient, kind of concurrent treatment, if any, frequency of treatment, and the nature of the effect desired. For any mode of administration, the actual amount of antitumor compound delivered, as well as the dosing schedule necessary to achieve the advantageous effects described herein, will also depend, in part, on such factors as the bioavailability of the antitumor compound, the disorder being treated, the desired therapeutic dose, and other factors that will be apparent to those of skill in the art. The dose administered to an animal, particularly a human, in the context of the present invention should be sufficient to effect the desired therapeutic response in the animal over a reasonable period of time. Preferably, an effective amount of the antitumor compound, whether administered orally or by another route, is any amount which would result in a desired therapeutic response when administered by that route. Preferably, the compositions for oral administration are prepared in such a way that a single dose in one or more oral preparations contains at least 20 mg of the antitumor compound per  $m^2$  of patient body surface area, or at least 50, 100, 150, 200, 300, 400, or 500 mg of the antitumor compound per  $m^2$  of patient body surface area, wherein the average body surface area for a human is  $1.8 m^2$ . Preferably, a single dose of a composition for oral administration contains from about 20 to about 600 mg of the antitumor compound per  $m^2$  of patient body surface area, more preferably from about 25 to about 400 mg/ $m^2$ , even more preferably, from about 40 to about 300 mg/ $m^2$ , and even more preferably from about 50 to about 200 mg/ $m^2$ . Preferably, the compositions for parenteral administration are prepared in such a way that a single dose contains at least 20 mg of the antitumor compound per  $m^2$  of patient body surface area, or at least 40, 50, 100, 150, 200, 300, 400, or 500 mg of the antitumor compound per  $m^2$  of patient body surface area. Preferably, a single dose in one or more parenteral preparations contains from about 20 to about 500 mg of the antitumor compound per  $m^2$  of patient body surface area, more preferably from about 40 to about 400 mg/ $m^2$ , and even more preferably, from about 60 to about 350 mg/ $m^2$ . However, the dosage may vary depending on the dosing schedule which can be adjusted as necessary to

achieve the desired therapeutic effect. It should be noted that the ranges of effective doses provided herein are not intended to limit the invention and represent preferred dose ranges. The most preferred dosage will be tailored to the individual subject, as is understood and determinable by one of ordinary skill 5 in the art without undue experimentation.

The concentration of the antitumor compound in a liquid pharmaceutical composition is preferably between about 0.01 mg and about 10 mg per ml of the composition, more preferably between about 0.1 mg and about 7 mg per ml, even more preferably between about 0.5 mg and about 5 mg per ml, and most 10 preferably between about 1.5 mg and about 4 mg per ml. Relatively low concentrations are generally preferred because the antitumor compound is most soluble in the solution at low concentrations. The concentration of the antitumor compound in a solid pharmaceutical composition for oral administration is preferably between about 5 weight % and about 50 weight %, based on the total 15 weight of the composition, more preferably between about 8 weight % and about 40 weight %, and most preferably between about 10 weight % and about 30 weight %.

In one embodiment, solutions for oral administration are prepared by dissolving an antitumor compound in any pharmaceutically acceptable solvent 20 capable of dissolving the compound (e.g., ethanol or methylene chloride) to form a solution. An appropriate volume of a carrier which is a solution, such as Cremophor® EL solution, is added to the solution while stirring to form a pharmaceutically acceptable solution for oral administration to a patient. If desired, such solutions can be formulated to contain a minimal amount of, or to 25 be free of, ethanol, which is known in the art to cause adverse physiological effects when administered at certain concentrations in oral formulations.

In another embodiment, powders or tablets for oral administration are prepared by dissolving an antitumor compound in any pharmaceutically acceptable solvent capable of dissolving the compound (e.g., ethanol or 30 methylene chloride) to form a solution. The solvent can optionally be capable of evaporating when the solution is dried under vacuum. An additional carrier can be added to the solution prior to drying, such as Cremophor® EL solution. The resulting solution is dried under vacuum to form a glass. The glass is then mixed with a binder to form a powder. The powder can be mixed with fillers or other 35 conventional tabletting agents and processed to form a tablet for oral administration to a patient. The powder can also be added to any liquid carrier as

described above to form a solution, emulsion, suspension or the like for oral administration.

Emulsions for parenteral administration can be prepared by dissolving an antitumor compound in any pharmaceutically acceptable solvent capable of 5 dissolving the compound (e.g., ethanol or methylene chloride) to form a solution. An appropriate volume of a carrier which is an emulsion, such as Liposyn® II or Liposyn® III emulsion, is added to the solution while stirring to form a pharmaceutically acceptable emulsion for parenteral administration to a patient. If desired, such emulsions can be formulated to contain a minimal amount of, or 10 to be free of, ethanol or Cremophor® solution, which are known in the art to cause adverse physiological effects when administered at certain concentrations in parenteral formulations.

Solutions for parenteral administration can be prepared by dissolving an antitumor compound in any pharmaceutically acceptable solvent capable of 15 dissolving the compound (e.g., ethanol or methylene chloride) to form a solution. An appropriate volume of a carrier which is a solution, such as Cremophor® solution, is added to the solution while stirring to form a pharmaceutically acceptable solution for parenteral administration to a patient. If desired, such solutions can be formulated to contain a minimal amount of, or to be free of, 20 ethanol or Cremophor® solution, which are known in the art to cause adverse physiological effects when administered at certain concentrations in parenteral formulations.

If desired, the emulsions or solutions described above for oral or parenteral administration can be packaged in IV bags, vials or other conventional containers 25 in concentrated form and diluted with any pharmaceutically acceptable liquid, such as saline, to form an acceptable taxane concentration prior to use as is known in the art.

- 25 **10-Triethylsilyl-10-deacetyl baccatin III.** To a solution of 1.0 g (1.84 mmol) of 10-deacetyl baccatin III in 50 mL of THF at -10 °C under a nitrogen atmosphere was added 0.857 mL (2.76 mmol, 1.5 mol equiv) of N,O-(bis)-TES-

trifluoroacetamide over a period of 3 min. This was followed by the addition of 0.062 mL of a 0.89 M THF solution of lithium bis(trimethylsilyl)amide (0.055 mmol, 0.03 mol equiv). After 10 min 0.038 mL (0.92 mmol, 0.5 mol equiv) of methanol was added, and after an additional 5 min 4 mL (0.055 mmol, 0.03 mol equiv) of acetic acid was added. The solution was diluted with 300 mL of ethyl acetate and washed two times with 100 mL of saturated aqueous sodium bicarbonate solution. The combined aqueous layers were extracted with 100 mL of ethyl acetate and the combined organic layers were washed with brine, dried over sodium sulfate, and concentrated under reduced pressure. To the residue was 5 added 100 mL of hexane and the solid (1.23 g, 101%) was collected by filtration. Recrystallization of the solid by dissolving in boiling ethyl acetate (20 mL, 17 mL/g) and cooling to room temperature gave 1.132 g (94%) of a white solid. m.p. 10 242 °C;  $[\alpha]_D^{25}$  -60.4 (c 0.7, CHCl<sub>3</sub>); <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400MHz) δ (p.p.m): 8.10 (2H, d, J<sub>m</sub> = 7.5Hz, BzO), 7.60 (1H, t, J<sub>m</sub> = 7.5Hz, Bzp), 7.47 (2H, t, J<sub>o</sub> = 7.5Hz, 15 Bzm), 5.64 (1H, d, J<sub>3</sub> = 6.9Hz, H<sub>2</sub>), 5.26 (1H, s, H<sub>10</sub>), 4.97 (1H, dd, J<sub>6β</sub> = 2.2Hz, J<sub>6α</sub> = 9.9Hz, H<sub>5</sub>), 4.85 (1H, dd, J<sub>14α</sub> = 8.9Hz, J<sub>14β</sub> = 8.9Hz, H<sub>13</sub>), 4.30 (1H, d, J<sub>20β</sub> = 8.5Hz, H<sub>20α</sub>), 4.23 (1H, ddd, J<sub>7OH</sub> = 4.5Hz, J<sub>6α</sub> = 6.6Hz, J<sub>6β</sub> = 11.0Hz, H<sub>7</sub>), 4.15 (1H, d, J<sub>20α</sub> = 8.5Hz, H<sub>20β</sub>), 4.00 (1H, d, J<sub>2</sub> = 6.9Hz, H<sub>3</sub>), 2.58 (1H, ddd, J<sub>7</sub> = 6.6Hz, J<sub>5</sub> = 9.9Hz, J<sub>6β</sub> = 14.5Hz, H<sub>6α</sub>), 2.28-2.25 (5H, m, 4Ac, 20 H<sub>14α</sub>, H<sub>14β</sub>), 2.02 (3H, s, 18Me), 1.97 (1H, d, J<sub>7</sub> = 4.5Hz, H<sub>7OH</sub>), 1.78 (1H, ddd, J<sub>7</sub> = 11.0Hz, J<sub>5</sub> = 2.2Hz, J<sub>6α</sub> = 14.5Hz, H<sub>6β</sub>), 1.68 (3H, s, 19Me), 1.56 (1H, s, OH<sub>1</sub>), 1.32 (1H, d, J<sub>13</sub> = 8.8Hz, OH<sub>13</sub>), 1.18 (3H, s, 17Me), 1.06 (3H, s, 16Me), 0.98 (9H, t, JCH<sub>2</sub>(TES) = 7.3Hz, CH<sub>3</sub>(TES)), 0.65 (6H, dq, JCH<sub>3</sub>(TES) = 7.3Hz, CH<sub>2</sub>(TES)).

25 **10-Triethylsilyl-10-deacetyl-7-methoxycarbonyl baccatin III.** To a solution of 9.3 g (14.1 mmol) of 10-triethylsilyl-10-deacetyl baccatin III and 10.35 g (84.6 mmol) of DMAP in 500 mL of dichloromethane at 0 °C under a nitrogen atmosphere was added 2.15 mL (22.7 mmol, 1.5 mol equiv) of methyl chloroformate. The mixture was stirred at 0 °C for 4 h, diluted with 300 mL of

saturated aqueous ammonium chloride solution and extracted twice with 200 mL of ethyl acetate. The organic layer was washed with 500 mL of 10% aqueous copper sulfate solution, 500 mL of saturated aqueous sodium bicarbonate solution, 100 mL of brine, dried over sodium sulfate and concentrated under reduced pressure. **2'-O-MOP-3'-desphenyl-3'-(2-thienyl)-10-triethylsilyl-7-methoxycarbonyl taxotere.** To a solution of 495 mg (0.690 mmol) of 10-triethylsilyl-10-deacetyl-7-methoxycarbonyl baccatin III in 4 mL of anhydrous THF under a nitrogen atmosphere at -45 °C was added 0.72 mL (0.72 mmol) of a 1M solution of LiHMDS in THF. After 0.5 h a solution of 278 mg (0.814 mmol) of the  $\beta$ -Lactam in 2 mL of anhydrous THF was added. The mixture was warmed to 0 °C, and after 2 h 0.5 mL of saturated aqueous sodium bicarbonate solution was added. The mixture was diluted with 50 ml of ethyl acetate and washed two times with 5 mL of brine. The organic phase was dried over sodium sulfate and concentrated under reduced pressure to give a slightly yellow solid. The solid was recrystallized by dissolving it in 12 mL of a 1:5 mixture of ethyl acetate and

hexane at reflux and then cooling to room temperature to give 679 mg (93%) of a white crystalline solid which was used directly in the next reaction.

The mixture was warmed to room temperature for 14 h and was then diluted with 20 mL of ethyl acetate and washed three times with 2 mL of saturated aqueous sodium bicarbonate and then with 8 mL of brine. The organic phase was dried over sodium sulfate and concentrated under reduced pressure to give 174 mg (100%) of a white solid. Example 5

15      *In Vitro* cytotoxicity measured by the cell colony formation assay

Four hundred cells (HCT116) were plated in 60 mm Petri dishes containing 2.7 mL of medium (modified McCoy's 5a medium containing 10% fetal bovine serum and 100 units/mL penicillin and 100 g/mL streptomycin). The cells were

incubated in a CO<sub>2</sub> incubator at 37 °C for 5 h for attachment to the bottom of Petri dishes. The compounds identified in Example 2 were made up fresh in medium at ten times the final concentration, and then 0.3 mL of this stock solution was added to the 2.7 mL of medium in the dish. The cells were then incubated with 5 drugs for 72 h at 37 °C. At the end of incubation the drug-containing media were decanted, the dishes were rinsed with 4 mL of Hank's Balance Salt Solution (HBSS), 5 mL of fresh medium was added, and the dishes were returned to the incubator for colony formation. The cell colonies were counted using a colony counter after incubation for 7 days. Cell survival was calculated and the values of 10 ID50 (the drug concentration producing 50% inhibition of colony formation) were determined for each tested compound.

## REMARKS

Upon entry of this Amendment B, claims 34 and 46-77 are currently pending and under consideration. Claims 1-33 were cancelled by this amendment; in canceling this subject matter from this application, applicants expressly reserve the right to pursue the remaining subject matter through one or more continuation applications. Claims 35-45 were previously cancelled by Amendment A.

### Status of Pending Claims

The Examiner has indicated that claims 34 and 57-77 are allowable. Claims 46-56, however, depend from claim 34 and thus incorporate all the requirements thereof. Consequently, applicant submits that claims 46-56 should be allowable and requests that the Office reconsider the status of these claims.

### Rejections Based on 35 U.S.C. §112, First Paragraph

Applicant respectfully requests reconsideration of the rejection of claims 1-33 and 46-56 under 35 U.S.C. §112, first paragraph as being non-enabled for containing subject matter that is not described in such a way as to enable one skilled in the art to which it pertains, or to which it is most nearly connected, to make and/or use the invention. In particular, the Examiner contends that the claimed compounds do not have the experimental data to support the claimed utilities which inhibit all kinds of tumors in the art. Claims 1-33 were cancelled by this Amendment B and thus this rejection is moot with respect to these claims. As discussed above, applicant believes claims 46-56 are allowable as dependent from an allowed base claim, claim 34. Claim 34 is directed to a method preparing a pharmaceutical composition and does not recite the "inhibiting tumor growth" language that forms the basis for the Office's rejection of claims 1-33.

Claims of Co-pending Application No. 11/082,380

In the interests of full disclosure, applicant hereby advises the Office that co-pending application no. 11/082,380 contains claims identical to those of allowed claims 57-77 (see claims 15-35). Claims 57-77 were originally cancelled from the pending application by Examiner's Amendment dated November 23, 2004. The claims were then re-filed in co-pending application no. 11/082,380 as claims 15-35. Based on a conversation with Examiner Trinh, however, the Examiner's Amendment was withdrawn along with the allowance in the pending case. To remedy the situation, claims 15-35 will be cancelled from pending application no. 11/082,380.
